

# Vendor Sizing Template Panel

A Photoshop tool that turns manual product-photo resizing into a single click

## What It Does

The Vendor Sizing Template Panel is a script-based tool that runs directly inside Photoshop — no separate installation or software needed. It automates resizing and finishing product photos to exact vendor and marketplace specifications.

- Reads sizing rules (canvas size, margins, alignment, resolution) from shared spec sheets, organized into **6 tabs** — Vendor Chrome, Cheshire, Onfigure, Marketplace, Photography, and Still\_Off Figure — each covering a different production category.
- The operator picks a category and item, checks a live preview of the exact photo and target size, and clicks **Submit**.
- On Submit, the tool automatically: runs the studio's standard retouching action (builds the Shadow/Reflection and Production layer structure, cuts out the subject, color-corrects), scales the product proportionally to fit the required margins without distorting it, expands the canvas to the exact target size with margins placed exactly as specified, sets the correct resolution, runs a final finishing action, and saves a layered TIFF into a **Completed** folder — leaving the original file completely untouched.
- One click can apply the same template to **every open image at once** (batch processing).

*The panel inside Photoshop — category, item, live preview, and sizing details, all in one place.*

## Errors It Prevents

- **No manual math mistakes** — margins, scale factor, and canvas size are calculated automatically and precisely from the spec sheet, not estimated by eye.
- **No image distortion** — width and height are always scaled by the same single factor, so products are never stretched or squashed.
- **Original files are never lost or overwritten** — the tool only ever writes a new TIFF into the Completed folder; the source file on disk is untouched.
- **No skipped production steps** — the studio's required retouching structure is applied the same way, every time, automatically, so nothing gets forgotten under deadline pressure.
- **No interrupted batch runs** — accidental save/overwrite or format-compatibility popups are eliminated.
- **No mismatched or misfiled preview photos** — file naming is validated and standardized automatically.

A few examples of the product categories the panel handles — belts, jewelry, handbags, cosmetics, tech accessories, footwear, and more:

## Time Savings

What used to be a multi-step manual process per image is now a single click. Batch mode applies one template to an entire folder of open images in one action instead of repeating the steps one by one. New team members can be productive almost immediately — the panel shows exactly what to pick, with a live preview, instead of requiring them to memorize or look up sizing specs.

| Step                      | Manual process                    | With this panel                       |
|---------------------------|-----------------------------------|---------------------------------------|
| Look up sizing spec       | Cross-check a spreadsheet by hand | Built into the panel, shown instantly |
| Calculate margins & scale | Manual math per image             | Calculated automatically              |
| Resize canvas             | Manual, multiple dialogs          | Automatic, exact pixel match          |
| Retouching structure      | Run action, check each step       | Applied automatically, every time     |

|                      |                                 |                                   |
|----------------------|---------------------------------|-----------------------------------|
| Save & file output   | Manual Save As + move to folder | Automatic TIFF saved to Completed |
| Apply to many images | Repeat every step per image     | One click for all open images     |

## Consistency Across the Team

- Every operator uses the exact same calculation, the exact same retouching structure, and the exact same output settings — there is no operator-to-operator variation in how an image is sized or finished.
- One shared spec sheet is the single source of truth for every category and size variant; updating it once updates it for the entire team instantly.
- Every output file follows the same format and folder structure, making downstream handoff and QA predictable.
